

SOLAR HOTEL DATABASE

Veda Charthad, Haeun Kim,
Aditi Mungale, Jihyung Park

Introduction

Introduction

DBMS

Our team will be using MySQL to develop the project

The goal

Our database is aimed to help the hotel have efficient management of operations

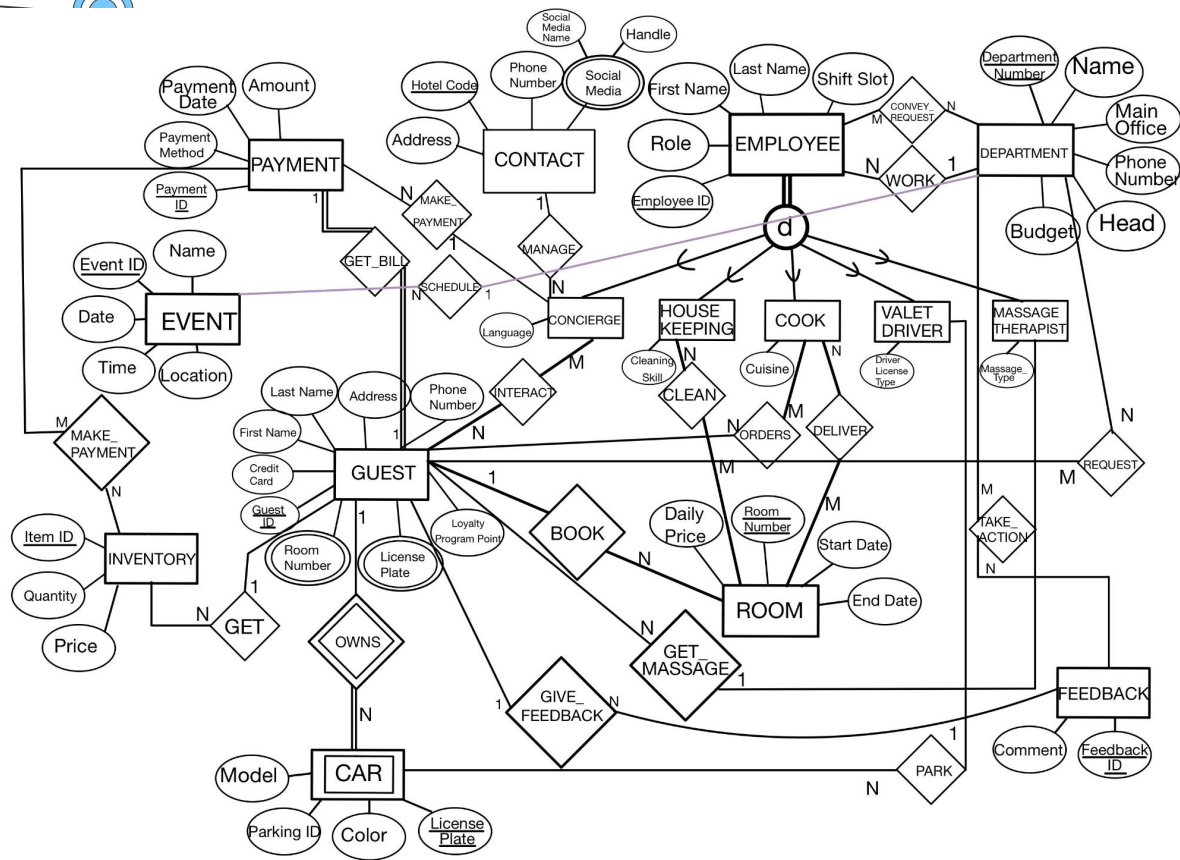

Eventual Users

The eventual users would be the employees of this hotel, especially the concierge

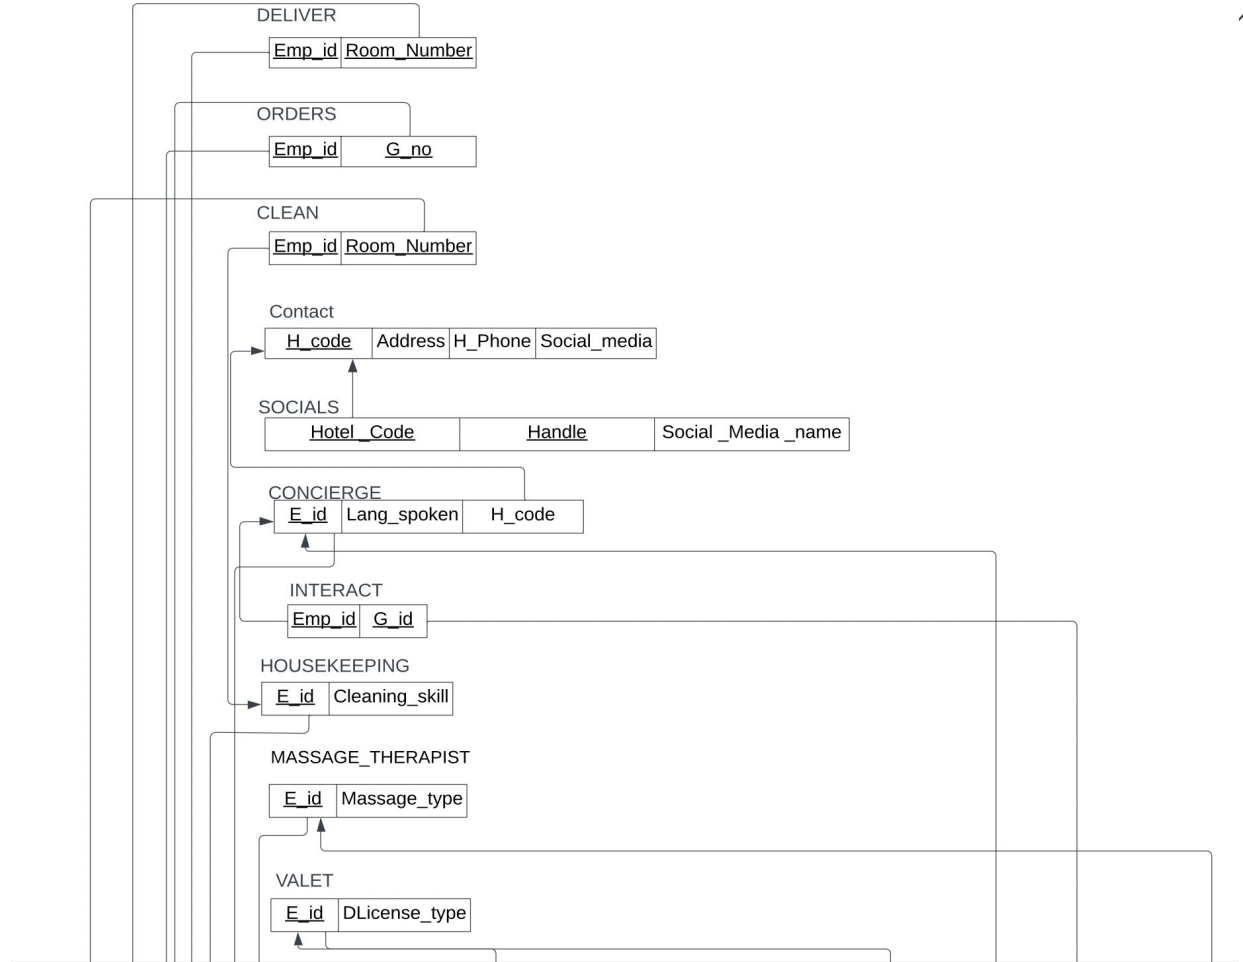

More about the Hotel

Business Challenges

- Solar Hotel's database is built in a way to handle large amounts of data and continue to provide efficient results when needed from the database.
- Different tables represent different entities and its respective attributes.
- We created integrity constraints in the tables that required them to prevent running into errors when making queries.
- Biggest challenge: how to uniquely identify guests, employees, and other key attributes without an overlap in identification numbers
 - Solution: We used drivers licence numbers for guests and social security numbers for employees.

DEMO

Website Interface and
SQL Workspace

Next Steps

- The database created accounts for a surge in customers and is able to handle an influx of data at a period of time.
- The creation of the database has allowed Solar Hotel to confirm reliability and security of their guests' information without a high risk of errors.
- Future plans: Increasing the speed of the database's operations and integrating features such as:
 - Rewards program for Solar Hotel,
 - Add specialized employee roles such as event manager or accountant
 - Add an additional layer of encryption since we use the SSNs of employees
 - Continue developing the website interface

A decorative graphic consisting of blue circles of varying sizes connected by thin black lines, forming a network-like structure around the central text. Some circles have concentric rings. Ellipses (...) are placed at several points along the lines.

Thanks!
